## Strategic Minerals Corporation NL, 100% Woolgar Gold Project, Queensland

### Testwork Indicates 96% Gold Recovery in Lower Camp

The Company is pleased to announce the results of the initial metallurgical testwork on the Big Vein South and Big Vein Central prospects in the Lower Camp of the Woolgar Project. This is the first part of a two stage metallurgical testwork program being conducted by the company to evaluate the metallurgical performance of the mineralisation.

Key results obtained from the program include:

- Gold recovery averaged 96% across the six samples tested;
- No refractory ore characteristics were observed in any of the tests, indicating the ore is suitable for gold recovery in a standard CIL processing plant;
- The consumption of reagents is considered moderate; and
- Silver, copper, lead and zinc values are moderate and are not considered to significantly affect the design of any future processing facilities, although a flotation circuit for the production of a base metal concentrate may be viable and will be examined later in the testwork program.

**Table 1: Summary of significant results.**

Prospect & Sector	Au Recovery, %	Au Grades, g/t
Big Vein Central - North & Central	96.61	5.11
Big Vein Central - Southern End	96.58	3.51
Big Vein South - Northern End	96.47	5.24
Big Vein South - North Central	97.32	5.59
Big Vein South - South-Central	93.11	4.03
Big Vein South - Southern End	96.25	5.10
<b>Average</b>	<b>96.06</b>	

## Program Summary

Strategic Minerals (SMC or The Company) commissioned Core Process Engineering (Core) ([www.coreresources.com.au](http://www.coreresources.com.au)) to carry out a testwork program to assign preliminary gold recovery values to the Woolgar mineralisation and identify any metallurgical characteristics. This is the first part of a two stage metallurgical program. Samples for the program were taken from the mineralisation identified over the past two years in the southern prospects at Woolgar.

The goals of the testwork program were to:

1. Determine reportable metallurgical Au recovery data, using standard cyanide leaching technology, across 6 identified zones of the mineralised body, reported herein.
2. Conduct preliminary investigations of processing options available to the project, which will provide data necessary for preliminary estimates of processing options and associated capex and opex.

Two packages of work were designed, reflecting these goals. The results reported here relate to the first stage test data. The second stage will further evaluate metallurgical responses, such as gravity extraction of gold and the rate of gold leaching in the CIL process.

The tests were conducted on six composite samples formed from 191 intervals selected from a variety of grades, depths and sectors within the prospects. These results will be used as a guide to continued exploration and investment by the Company. The sample material was selected to be representative of the mineralisation styles encountered to date. The sample material was selected from holes drilled during 2013 and 2014, and is from beneath the base of complete oxidation.

Material is no longer available from the highest (oxidised) levels, since this has been rehabilitated for environmental reasons. That mineralisation had been sampled for a previous round of testwork, as was the material in this study. Unfortunately, those results were inconclusive due to the variable head grades resultant from the coarse gold. For this reason Core were contracted to conduct a more robust testwork program.

The primary focus of these tests was on the gold recovery since this is the dominant metal of value in the system. Although silver, copper, lead and zinc also occur, these are relatively minor and are not expected to form a significant economic component of any project going forward. These metals were monitored for any potential effects that they may have on the leaching, recovery or consumption of reagents during processing. First indications from these tests suggest that such effects appear to be moderate and manageable within a normal processing circuit.

This is the first phase of metallurgical studies conducted on the mesothermal-style mineralisation encountered on the Woolgar Fault Zone and is not directly associated with either the epithermal or intrusion-related mineralisation in the Sandy Creek and Soapspar sectors, for which metallurgical studies have been conducted historically.

## Resource Preparation

These results will be incorporated in the updated resource calculation over the Big Vein South and Central prospects for which preparations are underway.

The Company's geological personnel are currently concentrating on better understanding the geology and alteration of the deposit. This is necessary to better model the mineralisation and the controls on it. This includes relogging of drillholes, field mapping and petrographic studies.

Wally Martin

MANAGING DIRECTOR

#### COMPETENT PERSON STATEMENT

The information in the report to which this statement is attached that relates to Exploration Targets or Exploration Results is based on information compiled by Alistair Grahame, a Competent Person who is a Member of The Australian Institute of Geoscientists. Mr Grahame is a full-time employee of Strategic Mineral Corporation NL. Mr Grahame has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Grahame consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The information in the report to which this statement is attached that relates to Metallurgy is based on information compiled by Chris Casingena, a Competent Person who is a Member of The Australasian Institute of Mining and Metallurgy. Mr Casingena is employed by Core Process Engineering. Mr Casingena has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Casingena consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Core Process Engineering was commissioned by Strategic Mineral Corporation to conduct these metallurgical tests. Core Process Engineering is an independent company that specialises in consulting on Metallurgy and Mineral Process Engineering. Neither Core Process Engineering nor any of its officers, have any financial nor other interest in Strategic Mineral Corporation N.L..

### Appendix One: Location Maps

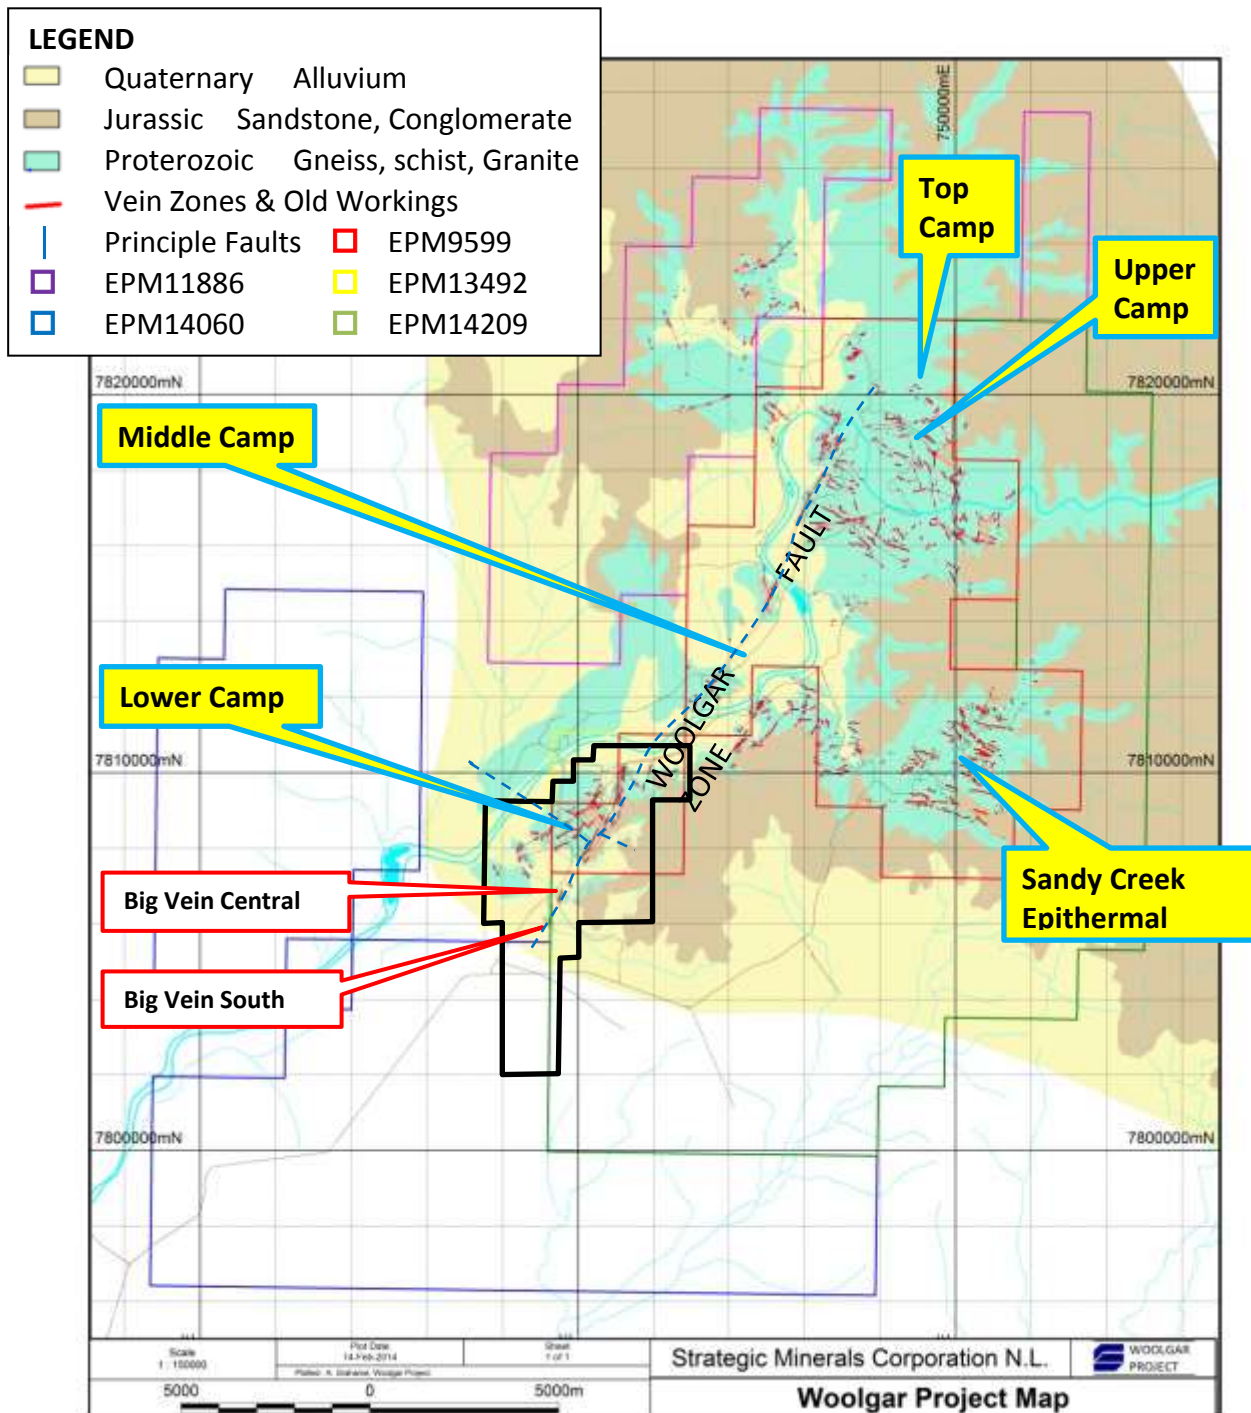

Figure 1: Simplified geological map of the Woolgar Project, highlighting the five main sectors (camps) and the Big Vein South and Central prospects, subject to this report. The combined area of the 2013 and 2014 Ground Magnetometry surveys is highlighted in black.

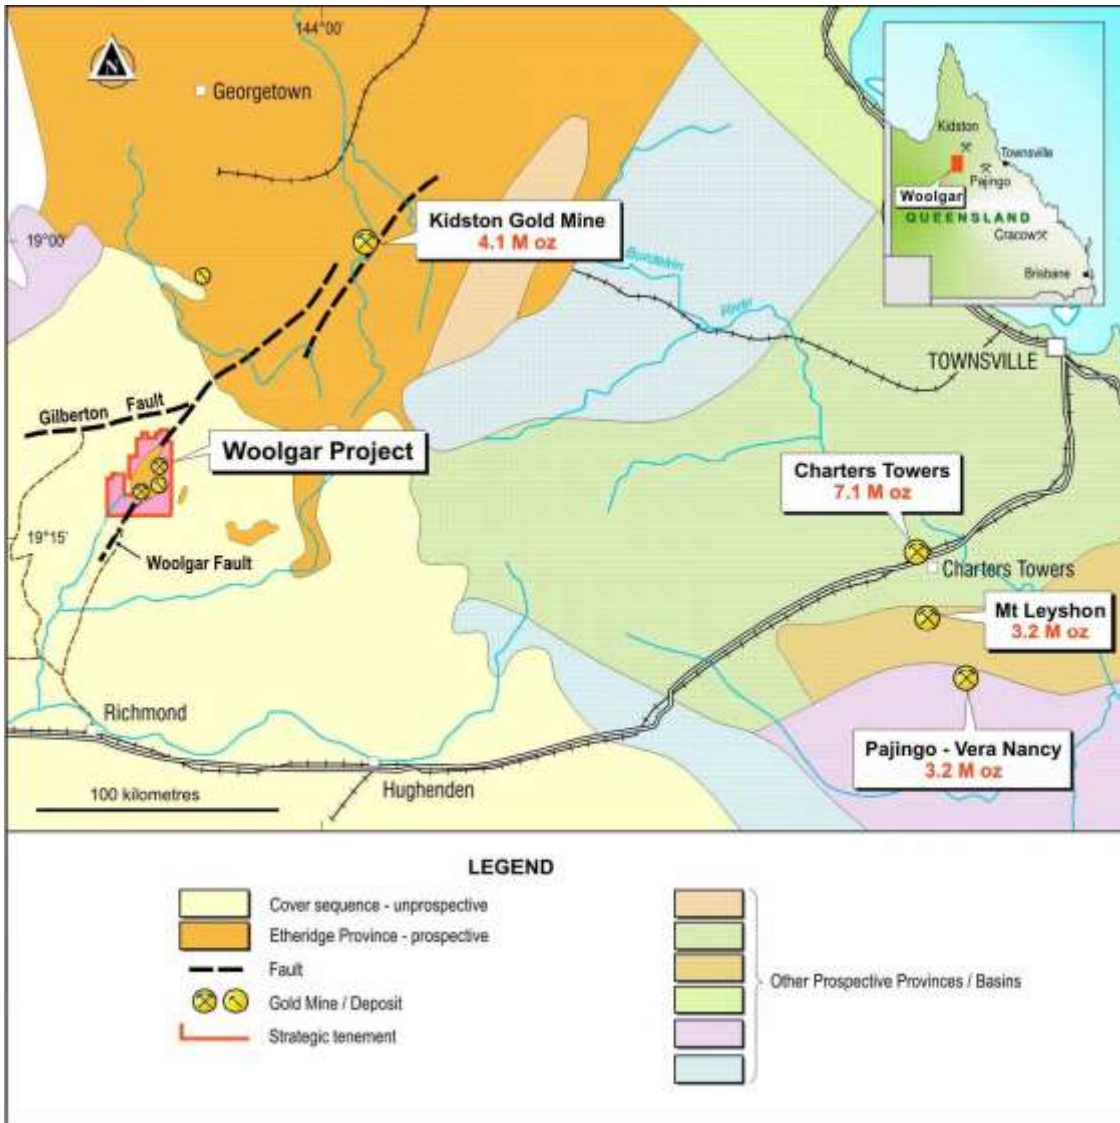

Figure 2: Location map of Woolgar, showing the regional provinces of northeast Queensland and significant gold deposits. As can be seen, the Woolgar Goldfield corresponds to an inlier (erosional window) of the highly prospective and historically productive Etheridge Province exposed within the overlying generally unprospective sedimentary cover sequences.

## Appendix Two

### JORC Code, 2012 Edition – Table 1 report template

#### Section 1 Sampling Techniques and Data

*(Criteria in this section apply to all succeeding sections.)*

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<ul style="list-style-type: none"> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<ul style="list-style-type: none"> <li>191 samples were selected from within 6 sub-divisions of the two adjacent prospects to produce 6 composite samples broadly representative of mineralisation within each sector.</li> <li>The procedure is considered appropriate to an initial indicative study of this nature.</li> <li>Samples were riffle split from the field reject material by trained SMC personnel.</li> </ul>
<b>Drilling techniques</b>	<ul style="list-style-type: none"> <li>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	<ul style="list-style-type: none"> <li>The material sampled is sourced from reverse circulation drilling with face hammer. Sample intervals were 1.0m.</li> <li>RC sampling was carried out by the drilling contractor using a cone-splitter integral with the recovery cyclone.</li> </ul>

Criteria	JORC Code explanation	Commentary
<b>Drill sample recovery</b>	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<ul style="list-style-type: none"> <li>Not applicable. No new drill results are presented herein.</li> </ul>
<b>Logging</b>	<ul style="list-style-type: none"> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	<ul style="list-style-type: none"> <li>Not applicable. No new drill results are presented herein.</li> </ul>
<b>Sub-sampling techniques and sample preparation</b>	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</li> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	<ul style="list-style-type: none"> <li>The original RC sample was cone split integrally to the cyclone.</li> <li>The metallurgical samples were selected to provide an approximate representation of the broader intervals and taken manually using a riffle splitter.</li> <li>All sample preparation and methods were appropriate for exploration purposes.</li> </ul>
<b>Quality of assay data and laboratory</b>	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> </ul>	<ul style="list-style-type: none"> <li>All metallurgical samples were prepared, composited, processed and assayed at Core Process Engineering with ICP assays subcontracted to</li> </ul>

Criteria	JORC Code explanation	Commentary
<b>tests</b>	<ul style="list-style-type: none"> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> <li>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</li> </ul>	<p>the ALS Minerals Division - Geochemistry (“ALS”) laboratory in Brisbane; an ISO-9001:2013 certified facility.</p> <ul style="list-style-type: none"> <li>Six 1kg composite samples were subjected to a 48 hour Sodium Cyanide Bottle Roll tests. Single analysis were taken at 48 hours. Filtrate- 5ml DiBK-AAS; Residual Solids: Au-FA. Dynamic leach and grind tests will be included in Stage 2.</li> <li>The Leachwell test methodology used in previous testwork by SMC produced unrealistic results which resulted in the rethink of the methodology employed to analyse the recovery of gold from the ore. Core Process Engineering were commissioned to manage this. A decision was made to move away from using Leachwell tests to the more robust and proven rolling bottle testing methodology. Using this methodology it was possible to back calculate the head grade from the leach products, effectively removing the biases created in assaying because of the presence or absence of small nuggets in the head samples.</li> </ul>
<b>Verification of sampling and assaying</b>	<ul style="list-style-type: none"> <li>The verification of significant intersections by either independent or alternative company personnel.</li> <li>The use of twinned holes.</li> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>Discuss any adjustment to assay data.</li> </ul>	<ul style="list-style-type: none"> <li>This report is prepared by independent consultants and has not been reviewed externally.</li> <li>This is prospective not definition work and no new drill results are presented herein.</li> <li>Head grades were back calculated by reconciling assays of both leach product and residual solids, rather than simple fire assay of the test material. The previous testwork by SMC had already</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>demonstrated that a standard 50g fire assay was unreliable due to the frequency of coarse gold.</p> <ul style="list-style-type: none"> <li>No other adjustments made to assay data.</li> </ul>
<b>Location of data points</b>	<ul style="list-style-type: none"> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> <li>Specification of the grid system used.</li> <li>Quality and adequacy of topographic control.</li> </ul>	<ul style="list-style-type: none"> <li>Not applicable. No new drill results are presented herein.</li> </ul>
<b>Data spacing and distribution</b>	<ul style="list-style-type: none"> <li>Data spacing for reporting of Exploration Results.</li> <li>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> <li>Whether sample compositing has been applied.</li> </ul>	<ul style="list-style-type: none"> <li>191 samples were selected from within 6 sub-divisions of the two adjacent prospects to produce 6 composite samples broadly representative of mineralisation within each sector.</li> <li>The samples were selected from within mineralised intervals from 13,000 metres of 2013 and 2014 RC drilling campaigns.</li> <li>The procedure is considered appropriate to an initial indicative study of this nature.</li> </ul>
<b>Orientation of data in relation to geological structure</b>	<ul style="list-style-type: none"> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	<ul style="list-style-type: none"> <li>Not applicable. No new drill results are presented herein.</li> </ul>
<b>Sample security</b>	<ul style="list-style-type: none"> <li>The measures taken to ensure sample security.</li> </ul>	<ul style="list-style-type: none"> <li>RC samples were collected in calico bags, sealed in sacks of five and loaded into pallet containers for transport to Brisbane by a private courier.</li> <li>A paper trail, including the contents of individual sacks</li> </ul>
